## Lab No. 10

## IPv4 Address Subnetting (Part 1)

## LEARNING OBJECTIVES

Upon completion of this activity, you will be able to determine network information for a given IP address and network mask.

## Background

This activity is designed to teach how to compute network IP address information from a given IP address.

## Scenario

When given an IP address and network mask, you will be able to determine other information about the IP address such as:

- Network address
- Network broadcast address
- Total number of host bits
- Number of hosts

Task 1: For a given IP address, Determine Network Information.
Given:

| Host IP Address | 172.25 .114 .250 |
| :--- | :--- |
| Network Mask | $255.255 .0 .0(/ 16)$ |

Find:

| Network Address |  |
| :--- | :--- |
| Network Broadcast Address |  |
| Total Number of Host Bits |  |
| Number of Hosts |  |

Step 1: Translate Host IP address and network mask into binary notation.
Convert the host IP address and network mask to binary:

|  | $\mathbf{1 7 2}$ | $\mathbf{2 5}$ | $\mathbf{1 1 4}$ | $\mathbf{2 5 0}$ |
| :--- | :---: | :---: | :---: | :---: |
| IP Address | 10101100 | 00011001 | 01110010 | 11111010 |
| Network Mask | 11111111 | 11111111 | 00000000 | 00000000 |
|  | $\mathbf{2 5 5}$ | $\mathbf{2 5 5}$ | $\mathbf{0}$ | $\mathbf{0}$ |

Step 2: Determine the network address.

1. Draw a line under the mask.
2. Perform a bit-wise AND operation on the IP address and the subnet mask.

Note: 1 AND 1 results in a $1 ; 0$ AND anything results in a 0 .
3. Express the result in dotted decimal notation.
4. The result is the network address for this host IP address, which is $\mathbf{1 7 2 . 2 5 . 0 . 0}$.

Option 2 if you are vision impaired:
Look at the network mask and convert it to binary if necessary to determine how many bits are in network portion of address.
Convert this many bits of the ip address to binary by converting byte for byte and leaving in leading and trailing zeros.
You should always end up with 32-bits.
You can and the netmask in binary with the ip address in binary; the jaws notepad scripts may be good for this.
Remember 1 and 1 is 1 ,
Anything and 0 is zero.
Set the remaining bits to 0 and convert this back to dotted decimal to get network address. Network address is an ip address where all the host bits are set to zero.

|  | $\mathbf{1 7 2}$ | $\mathbf{2 5}$ | $\mathbf{1 1 4}$ | $\mathbf{2 5 0}$ |
| :--- | :---: | :---: | :---: | :---: |
| IP Address | 10101100 | 00011001 | 01110010 | 11111010 |
| Subnet Mask | 11111111 | 11111111 | 00000000 | 00000000 |
| Network Address | 10101100 | 00011001 | 00000000 | 00000000 |
|  | $\mathbf{1 7 2}$ | $\mathbf{2 5}$ | $\mathbf{0}$ | $\mathbf{0}$ |

## Step 3: Determine the broadcast address for the network address

The network mask separates the network portion of the address from the host portion. The network address has all 0 s in the host portion of the address and the broadcast address has all 1 s in the host portion of the address.

Option 2: set all the host bits to 1 and convert this to decimal to find out broadcast address for the network.

Leave the network bits alone.

|  | 172 | $\mathbf{2 5}$ | 0 | 0 |
| :--- | :---: | :---: | :---: | :---: |
| Network Add. | 10101100 | 00011001 | 00000000 | 00000000 |
| Mask | 1111111 | 11111111 | 0000000 | 00000000 |
| Broadcast. | 10101100 | 00011001 | 1111111 | 11111111 |
|  | $\mathbf{1 7 2}$ | $\mathbf{2 5}$ | $\mathbf{2 5 5}$ | $\mathbf{2 5 5}$ |

By counting the number of host bits, we can determine the total number of usable hosts for this network.
Host bits: 16
Total number of hosts:

$$
2^{16}=65,536
$$

$65,536-2=65,534$ (addresses that cannot use the all 0s address, network address, or the all 1 s address, broadcast address.)
Add this information to the table:
Option 2: If we know how many bits we have for network address then $\mathrm{h}=32-\mathrm{n}$ where n is number of network bits. If we have 16 network bits, then $32-16=16$ host bits.
2 to the power of h minus 2 will give us the number of hosts where h is the number of host bits.

| Host IP Address | $\mathbf{1 7 2 . 2 5 . 1 1 4 . 2 5 0}$ |
| :--- | :--- |
| Network Mask | $\mathbf{2 5 5 . 2 5 5 . 0 . 0}(/ \mathbf{1 6})$ |
| Network Address | 172.25 .0 .0 |
| Network Broadcast Address | 172.25 .255 .255 |
| Total Number of Host Bits | 16 bits or 216 or 65,536 total hosts |
| Number of Hosts | $65,536-2=65,534$ usable hosts |

## Task 2: Challenge

## For all problems:

Create a Subnetting Worksheet to show and record all work for each problem.
Problem 1

| Host IP Address | 172.30 .1 .33 |
| :--- | :--- |
| Network Mask | 255.255 .0 .0 |
| Network Address | 172.30 .1 .33 |
| Network Broadcast Address | 172.30 .255 .255 |
| Total Number of Host Bits | 16 |
| Number of Hosts | 65.534 |

Problem 2

| Host IP Address | 172.30 .1 .33 |
| :--- | :--- |
| Network Mask | 255.255 .255 .0 |
| Network Address | 172.30 .1 .0 |
| Network Broadcast Address | 172.30 .1 .255 |
| Total Number of Host Bits | 8 |
| Number of Hosts | 254 |

Problem 3

| Host IP Address | 192.168 .10 .234 |
| :--- | :--- |
| Network Mask | 255.255 .255 .0 |
| Network Address | 192.168 .10 .0 |
| Network Broadcast Address | 192.168 .1 .255 |
| Total Number of Host Bits | 8 |
| Number of Hosts | 254 |

Problem 4

| Host IP Address | 172.17 .99 .71 |
| :--- | :--- |
| Network Mask | 255.255 .0 .0 |
| Network Address | 172.17 .0 .0 |
| Network Broadcast Address | 172.17 .255 .255 |
| Total Number of Host Bits | 16 |
| Number of Hosts | 65,534 |

## Problem 5

| Host IP Address | 192.168 .3 .219 |
| :--- | :--- |
| Network Mask | 255.255 .0 .0 |
| Network Address | 192.168 .0 .0 |
| Network Broadcast Address | 192.168 .255 .255 |
| Total Number of Host Bits | 16 |
| Number of Hosts | 65,534 |

Problem 6

| Host IP Address | 192.168 .3 .219 |
| :--- | :--- |
| Network Mask | 255.255 .255 .224 |
| Network Address | 192.168 .3 .323 |
| Network Broadcast Address | 192.168 .3 .223 |
| Total Number of Host Bits | 5 |
| Number of Hosts | 30 |
