

Network Design in the Supply Chain

Learning Objectives

- Understand the role of network design in a supply chain.
- Identify factors influencing supply chain network design decisions.
- Develop a framework for making network design decisions.
- Use optimization for facility location and capacity allocation decisions.

Network Design Decisions

Facility role

✤ What role, what processes?

Facility location

Where should facilities be located?

Capacity allocation

How much capacity at each facility?

Market and supply allocation

What markets? Which supply sources?

Factors Influencing Network Design Decisions

- Strategic factors
- Technological factors
- Macroeconomic factors
 - Tariffs and tax incentives
 - Exchange-rate and demand risk
 - Freight and fuel costs
- Political

Factors Influencing Network Design Decisions

- Infrastructure factors
- Competitive factors
 - Positive externalities between firms
 - Locating to split the market
- Customer response time and local presence
- Logistics and facility costs

• Phase I: Define a supply chain strategy/design

- Clear definition of the firm's competitive strategy
- Forecast the likely evolution of global competition
- Identify constraints on available capital
- Determine growth strategy

Socio Economic Factors in Choice of Facility Location

- What role do socio-economic factors play in the selection of the facility location?
- How do state policies aimed at promoting balanced regional development, shape the supply chain network designs?

Sunil Chopra, Peter Meindl and D. V. Kalra PEARSON

Supply Chain Management: Strategy, Planning, and Operation, 5/e Authors: Sunil Chopra, Peter Meindl and D. V. Kalra

Phase II: Define the regional facility configuration

- Forecast of the demand by country or region
- ✤ Economies of scale or scope
- Identify demand risk, exchange-rate risk, political risk, tariffs, requirements for local production, tax incentives, and export or import restrictions
- Identify competitors

Phase III: Select a set of desirable potential sites

- Hard infrastructure requirements
- Soft infrastructure requirements
- Phase IV: Location choices

Models for Facility Location and Capacity Allocation

- Maximize the overall profitability of the supply chain network while providing customers with the appropriate responsiveness
- Many trade-offs during network design
- Network design models used to decide on locations and capacities and to assign current demand to facilities

Models for Facility Location and Capacity Allocation

- Important information
 - Location of supply sources and markets
 - Location of potential facility sites
 - Demand forecast by market
 - ✤ Facility, labor, and material costs by site
 - Transportation costs between each pair of sites
 - Inventory costs by site and as a function of quantity
 - Sale price of product in different regions
 - Taxes and tariffs
 - Desired response time and other service factors

Phase II: Network Optimization Models

 x_n , y_n : Coordinate location of either a market or supply source n

- F_n : Cost of shipping one unit for one mile between the facility and either market or supply source n
- D_n : Quantity to be shipped between facility and market or supply source n

(x, y) is the location selected for the facility, the distance d_n between the facility at location (x, y) and the supply source or market n is given by

$$d_n = \sqrt{\left(x - x_n\right)^2 + \left(y - y_n\right)^2}$$

Figure 5-13

Supply Chain Management: Strategy, Planning, and Operation, 5/e Authors: Sunil Chopra, Peter Meindl and D. V. Kalra

Model inputs

- m = Number of markets or demand points
- n = Number of potential factory locations
- / = Number of suppliers
- t = Number of potential warehouse locations
- D_j = Annual demand from customer j
- $\vec{K_i}$ = Potential capacity of factory at site *i*
- S_h = Supply capacity at supplier h
- W_e = Potential warehouse capacity at site *e*
 - $\vec{F_i}$ = Fixed cost of locating a plant at site *i*
 - f_e = Fixed cost of locating a warehouse at site *e*
- c_{hi} = Cost of shipping one unit from supply source h to factory i
- c_{ie} = Cost of producing and shipping one unit from factory *i* to warehouse *e*
- c_{ej} = Cost of shipping one unit from warehouse e to customer j

 Goal is to identify plant and warehouse locations and quantities shipped that minimize the total fixed and variable costs

 $Y_i = 1$ if factory is located at site *i*, 0 otherwise

- $Y_e = 1$ if warehouse is located at site *e*, 0 otherwise
- x_{ej} = Quantity shipped from warehouse *e* to market *j*
- x_{ie} = Quantity shipped from factory at site *i* to warehouse *e*
- x_{hi} = Quantity shipped from supplier *h* to factory at site *i*

$$Min \overset{n}{\overset{n}{\underset{i=1}{\overset{n}{\overset{}}{a}}}} F_{i}y_{i} + \overset{t}{\overset{n}{\underset{e=1}{\overset{}{a}}}} f_{e}y_{e} + \overset{l}{\overset{n}{\underset{h=1}{\overset{n}{\overset{}}{a}}}} \overset{n}{\underset{i=1}{\overset{n}{\overset{}}{a}}} c_{hi}x_{ie} + \overset{t}{\overset{n}{\underset{e=1}{\overset{n}{\overset{}}{a}}}} \overset{m}{\underset{e=1}{\overset{n}{\overset{}}{a}}} c_{ej}x_{ej}$$

subject to

Accounting for Taxes, Tariffs, and Customer Requirements

- A supply chain network should maximize profits after tariffs and taxes while meeting customer service requirements
- Modified objective and constraint

$$Max \mathop{a}\limits^{m}_{j=1} r_{j} \mathop{a}\limits^{n}_{i=1} x_{ij} - \mathop{a}\limits^{n}_{i=1} F_{i}y_{i} - \mathop{a}\limits^{n}_{i=1} \mathop{a}\limits^{m}_{j=1} c_{ij}x_{ij}$$

$$\overset{"}{\underset{i=1}{\overset{n}{\overset{}}}} x_{ij} \notin D_j \text{ for } j = 1, \dots, m$$

Supply Chain Management: Strategy, Planning, and Operation, 5/e Authors: Sunil Chopra, Peter Meindl and D. V. Kalra

Making Network Design Decisions in Practice

- Do not underestimate the life span of facilities
- Do not gloss over the cultural implications
- Do not ignore quality-of-life issues
- Focus on tariffs and tax incentives when locating facilities

Summary of Learning Objectives

- Understand the role of network design in a supply chain
- Identify factors influencing supply chain network design decisions
- Develop a framework for making network design decisions
- Use optimization for facility location and capacity allocation decisions
