# Well cuttings

- *Cuttings* are the small pieces of rock that are chipped away by the bit while a well is being drilled.
- Well cuttings are sampled at regular interval usually **2 m** (wildcat wells) and **5 m** (production wells).
- Interval is short at reservoir is strike called ditch sample.

# Why Cutting Analysis?

<b>Stratigraphic Description</b>	<ul style="list-style-type: none"><li>• Selection of the right drill bit</li><li>• Configuration of the mud system</li><li>• Fixing the exact casing depth</li><li>• Final decision for a core run</li></ul>
<b>Petrographic Characteristics</b>	<ul style="list-style-type: none"><li>• Characterisation of a reservoir</li><li>• Basic parameter of hydraulic systems</li></ul>
<b>Petrographic &amp; mineralogical Composition</b>	<ul style="list-style-type: none"><li>• Input parameter for the log interpretation (EFA Log)</li></ul>
<b>Cutting analysis in general</b>	<ul style="list-style-type: none"><li>• Redundance and back up in case of trouble (e.g. loss of borehole measurements due to bad caliper, inclination of the hole, stuck pipe, coring)</li></ul>

# Basin and sedimentary cover

# Stratigraphic Analysis

# Stratigraphic Cross Section

# Structural Cross Section

# Petrography

(Mineralogy, Grain size, Fossil and Pore type)

# Advantage of Cutting Analysis

- Cheap and quick study
- First or only opportunity to look at the rock
- Immediate interpretation of Sed. Sequence
- Only small quantity of material required.
- Selection of fragments to be analyzed.
- Individual analysis of each fragments.
- Averaging of rock types over a certain interval
- Detailed information on rock composition, texture, fossil, ...

# How Bits Drill?

Roller cone bit with no offset

Roller cone bit with offset

# How Bits Drill?

## Cutting Size

PDC bit

Natural diamond bit

Diamond-impregnated bit

# How many Cuttings per Meter?

During a well drilling, the crushed cylinder of formation which is drilled to make the hole is released into the mud stream. Once released, the formation and any contained fluids, gas or oil are carried to the surface by the mud.

# Cuttings Volume

Hole Size	Section Length	Section Volume	Time to Drill
24"	600m	175m <sup>3</sup>	2 days
17 ½"	1400m	217m <sup>3</sup>	14 days
12 ¼"	1500m	76m <sup>3</sup>	30 days
8 ½"	1000m	37m <sup>3</sup>	40 days
Total	4500m	505m <sup>3</sup>	90 days

±1200 Tonnes  
±165 Truck Loads

# What is the Lag-Time?

„Lag-Time“ is the definite time interval, which is always required for pumping the samples from a particular depth to the surface where they become accessible.

The lag-time applies to all downhole information, the formation cuttings and the fluids (gas, oil and water) which they contain.

# Sample lagging

## Lag time depends on:

- Depth
- Pump Rate
- Drill String Size
- Casing Diameter
- Hole Size
- Mud
- Mud Condition

## Lag can be determined by:

- Calculation
- Tracer Tests

# Lag Time Calculation

## Problems:

- Borehole breakouts
- Mud channels in the annulus

$$\text{Lag time} = \frac{\text{Depth}}{\text{Annular Velocity}}$$

$$\text{Annular Velocity} = \frac{\text{Pump Output}}{\text{Annular Volume}}$$

$$\text{Annular Volume} = \text{Hole Capacity} - \text{Pipe (Capacity + Displacement)}$$

# Lag Time Calculation

## Results:

12.380 strokes

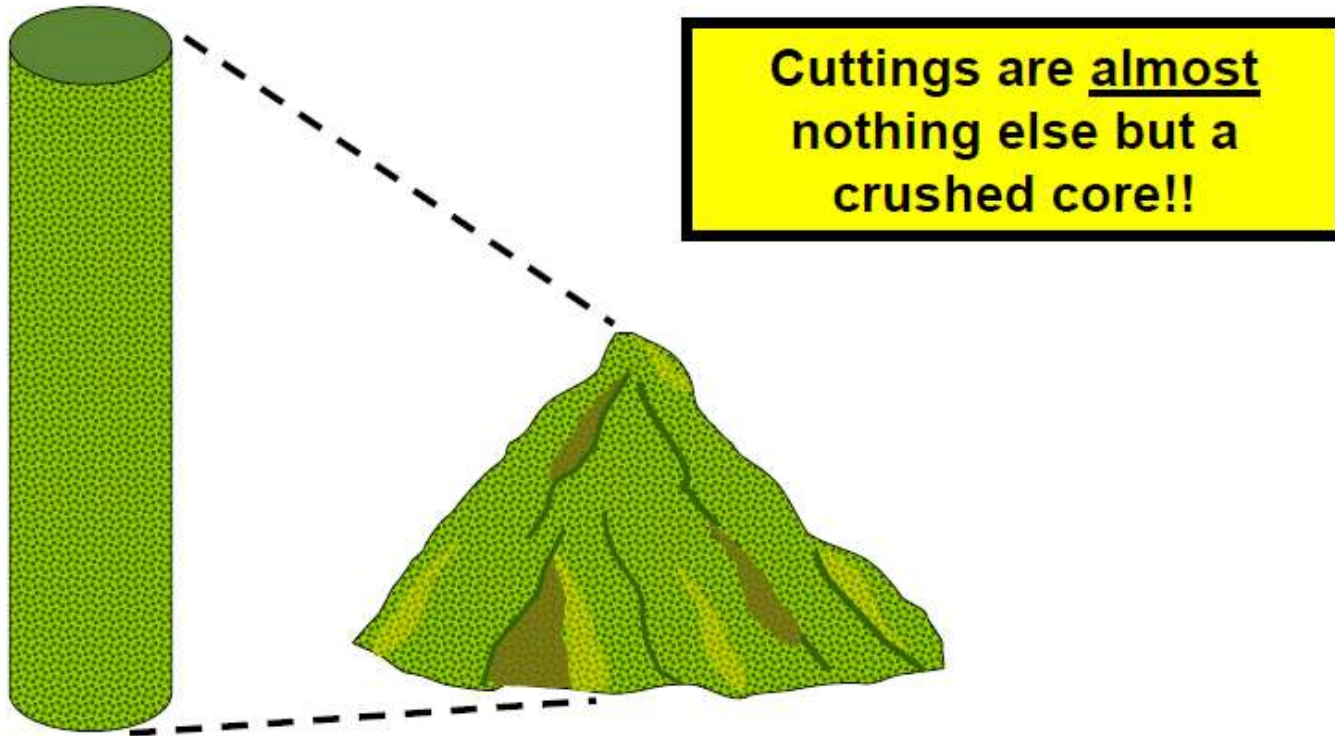

130,3 minutes

8,7 meters\*

\*) ROP = 4 m/h

Various materials (such as whole oats, rice, barley or lentils) may be used as tracers and picked up on the shaker screen for approximating the lag.

# Cuttings and Core?!

The drill bit and circulation perform a mechanical running average on the lithologies penetrated.

# Contaminations

MINERALS	ORGANIC AND SYNTHETIC MATERIALS	METALS (SEE TABLE 2)
<p><u>Drilling mud clays:</u></p> <ul style="list-style-type: none"> <li>-Bentonite (montmorillonite ± illite, mixed-layer clay and kaolinite)</li> <li>-Attapulgite or sepiolite</li> </ul> <p><u>Drilling mud weighting Agents</u></p> <ul style="list-style-type: none"> <li>-Barite</li> <li>-Hematite</li> <li>-Calcite</li> <li>-Galena</li> <li>-Ilmenite</li> </ul> <p><u>Cement</u></p> <p><u>Cement additives</u></p> <ul style="list-style-type: none"> <li>-Silica flour</li> <li>-Perlite</li> <li>-Pozzolan</li> <li>-Diatomaceous earth</li> <li>-Bentonite</li> <li>-Hematite</li> <li>-Barite</li> <li>-Mica</li> <li>-Quartz sand</li> <li>-Gypsum</li> </ul>	<p><u>Drilling mud thinners and dispersants</u></p> <ul style="list-style-type: none"> <li>-Lignite and lignosulfonate</li> </ul> <p><u>Drilling mud lubricants</u></p> <ul style="list-style-type: none"> <li>-Silica or glass spheres</li> </ul> <p><u>Lost-circulation materials</u></p> <ul style="list-style-type: none"> <li>-Nut Shells</li> <li>-Wood fiber</li> <li>-Cane fiber</li> <li>-Seed hulls</li> <li>-Paper</li> <li>-Lignite (coarse)</li> <li>-Cellophane</li> <li>-Processed formica and other plastics</li> <li>-Miscellaneous locally available material such as alfalfa cubes</li> </ul> <p><u>Cement Additives</u></p> <ul style="list-style-type: none"> <li>-gilsonite and coal</li> </ul> <p><u>Rubber and Plastic</u></p> <ul style="list-style-type: none"> <li>-Jackets on cement plugs</li> </ul>	<p><u>Metal shavings from the drilling system</u></p> <ul style="list-style-type: none"> <li>-Steel, brass, etc.</li> </ul> <p><u>Drillable metal from downhole cementing assemblies</u></p> <ul style="list-style-type: none"> <li>-Lead, iron and aluminum</li> </ul> <p><u>Coloring agents</u></p> <p><u>Metals in thread compounds and other greases</u></p>

# Cavings

**Cavings = Cuttings from previously drilled intervals**

**Recognizable:**

**large, splintery rock fragments,**

**often concave, convex in cross-section,**

**Identical with formations from higher sections,**

**Reasons:**

**Hydraulic deconsolidation due changing of the mud conditions**

**Mechanical impacts caused by the bottom hole assembly**

# Cuttings vs. Cavings

# Bit-metamorphism

Differences in color, shape, and strength:

- brighter colors
- grayer dark colors
- convex/concave shape
- metallic striation
- low mechanical strength

# Cause of Bit-metamorphism

Digging and Dragging

# LCM materials

Cuttings from zones of lost circulation are often intermixed with lost circulation material.

# Mixing of Cuttings During a Trip

- Mud Viscosity
- When well is drilled at 1800ft it will take well cuttings takes 3hours up to the surface.

# Borehole Break-Outs

Various materials (such as whole oats, rice, barley or lentils) may be used as tracers and picked up on the shaker screen for approximating the lag.

# Stuck Pipe

**All irregularities have  
to be reported to the  
driller!**

# Bottoms-up

## Solution:

Circulating the mud bottoms-up before tripping out!

## But:

It needs additional time > money!

(2000 m drillhole approx. 22 minutes)

# Sample Types

## 1) Wet Sample (unwashed):

- ❖ Micropaleontological sample
- ❖ Palynological sample
- ❖ Petrographical sample

## 2) Dry Sample (washed):

- ❖ Stratigraphical sample (mud logging)
- ❖ Geochemical sample
- ❖ Geomechanical sample

# Sample Catching

# Sample Washing

# Sample Drying

# Cutting petrography

## Cuttings Sample Description

1. Rock name
2. Color
3. Hardness, fissility
4. Elements or grains
  - Clastics
  - Carbonates
  - a. grain size
  - a. "grain" nature
  - b. roundness
  - b. "grain" size
  - c. sphericity
  - d. sorting
5. Cement and matrix
  - Clastics
  - Carbonates
  - a. abundance
  - a. abundance
  - b. nature
  - b. crystallinity
6. Accessories, fossils
7. Visual porosity estimation
8. Hydrocarbon indications
  - a. visual (stains and bleeding)
  - b. direct fluorescence (extent, intensity and color)
  - c. cut fluorescence (rate, intensity and color)

Red Shale

Brown Shale

Gray Shale

Limestone

Sand grain

Consolidated sand

Limestone conglomerate  
w/ imbedded glauconite (green)

Sample of drill cuttings under a 10x microscope
