## Friction Notes

Overview

## Friction!

http://www.maniacworld.com/ducks-landing-on-ice.html
OK... so what is it?

## Friction Description

## Definition

${ }^{-}$A force that opposes motion

- When a force is applied to a body resting on a rough plane so that the body moves or tends to move, a frictional force acts on the body in opposition to the applied force.

## Friction

- Symbol
${ }^{\circ} \mathrm{F}_{\mathrm{f}}$
- Units
- Newtons (it's a force!)

Depends on

- Weight of object (normal force)
- Nature of the surfaces between the moving object and the supporting surface

## Friction

- Two types
- Static friction (pushing the piano but no motion)
- Sliding (kinetic) friction (piano moves!!!)
- Static force > kinetic force

## Friction

## Formula

$$
\boldsymbol{\mu}=\frac{F_{f}}{F_{N}} \operatorname{or}_{f}=\boldsymbol{\mu} F_{N} \quad \text { where }
$$

- $\mu=$ coefficient of friction,
- values usually between 0 and 1
- Note:
- Low $\mu$ = slippery
- High $\mu$ = sticky
- $\mathrm{F}_{\mathrm{N}}=$ normal force dependent on weight vector

## Examples of $\mu$

| Surfaces | Static | Sliding |
| :--- | :--- | :--- |
| Hardwood on hardwood | 0.5 | 0.25 |
| Rubber on dry concrete | 1.0 | 0.75 |
| Rubber on wet concrete | 0.75 | 0.5 |
| Steel on steel | 0.74 | 0.6 |
| Steel on steel (lub'd) | 0.15 | 0.06 |
| Human joints | 0.01 | 0.003 |

## Stages of Friction

## Plot of applied force vs friction force

Frictional force

## Friction Practice

- If it takes 200 N to move a 100 kg box across a flat floor at constant speed, what is the coefficient of friction $(\mu)$ ?
- Solution
- Constant speed means no acceleration, so the applied force is balancing the friction force or a state of equilibrium exists $\therefore \mathrm{F}_{\mathrm{a}}=\mathrm{F}_{\mathrm{f}}$
${ }^{-} \mu=F_{f} / F_{\mathrm{n}}=\mathrm{F}_{\mathrm{a}} / \mathrm{mg}$
${ }^{\circ}=200 /(100 * 9.8)=\sim 0.2$

## Inclined Plane with Friction

Skier mass=m

## Friction on Inclined Plane

## Practice Inclined plane

What is the force of friction $\left(F_{f}\right)$ between a 105 kg crate on a plane inclined at $30^{\circ}$, with a coefficient of friction of 0.3 ?

- Solution
- Use inclined plane diagram to find
- $F_{f}$
- $F_{\|}$
- $F_{\text {net }}$
- a

## Summary - Newton's 2nd Law: $F_{\text {net }}=\mathbf{m a}$

## Flat plane

- $\mathrm{a}=\mathrm{F}_{\text {net }} / \mathrm{mass}$
${ }^{\bullet} a=\left(F_{a}-F_{f}\right) / m$
- $\mathrm{a}=\left(\mathrm{F}_{\mathrm{a}}-\mu . \mathrm{F}_{\mathrm{n}}\right) / m$
${ }^{\circ} \mathrm{a}=\left(\mathrm{F}_{\mathrm{a}}-\mu \cdot \mathrm{mg}\right) / \mathrm{m}$

## Summary - Newton's 2nd Law: $F_{\text {net }}=\mathbf{m a}$

## Inclined plane

${ }^{\circ} \mathrm{a}=\mathrm{F}_{\text {net }} / \mathrm{mass}$
${ }^{-} \mathrm{a}=\left(\mathrm{F}_{\|}-\mathrm{F}_{\mathrm{f}}\right) / \mathrm{m}$
