# **Introduction to Risk Analysis**

Chesapeake AIHA/ASSE Educational Seminar March 13, 2013 Charles Yoe, Ph.D. cyoe1@verizon.net

# Risk Analysis and Industrial Hygiene

<text><text><text><text><text><text><text>

Assessment'

- "Risk analysis methods and tools are important resources for articulating scientific knowledge to those who make decisions regarding public and occupational health." Synergist April, 2012
- "Risk analysis is a framework for decision making under uncertainty."

Me March, 2013

### The Point

### Risk

### **Managing Risk**

### Risk Assessment ≠ Safety Assessment

- The public wants safety
- Safety is a subjective determination
  - Chemicals used under reasonably foreseeable conditions should not adversely affect humans and the environment
  - Someone must decide what safe is
  - Subjective decisions rarely satisfy everyone
- Risk is a more objective concept

Safety

ves/no

# OEL = NOEL/Safety Factor x Breathing Rate

Safety Factor =  $10 \times 10$ Breathing Rate =  $10 \text{ m}^3 \text{ 8-hr shift}$ 

Daily exposures below OEL are safe ?

Daily exposure above OEL are not safe ?

Is it more likely yes/no or more/less?

0.005 OEL

5 NOEL

μg/day

# Risk

- Risk is a measure of the probability and consequence of uncertain future events
  - Risk = Probability x Consequence
- In industrial hygiene
  - Risk = Likelihood x Severity

Toxicity/adverse effects on humans, environment or other endpoints

Exposure = e(frequency, duration, magnitude, pathway/route)

# "Flavors" of Risk

- Risk includes
  - Exposure to losses (hazards)
    - Risk managers avoid risks
  - Potential for gain (opportunities)
    - Risk managers take risks

# **Uncertainty Leads To Risk**

#### **Macro-Level (Values)**

- Increasing social complexity
- Rapidly increasing pace of change
- Global effects

#### **Micro-Level (Facts)**

- Knowledge uncertainty
- Natural variability

Uncertainty Ahead

# **Micro-Level Uncertainty**

Risk Analysis->Decision-Making Under Uncertainty

#### **Risk Assessment**

Analytically based

#### **Risk Management**

 Policy and preference based

#### **Risk Communication**

•Interactive exchange of information, opinions, and preferences concerning risks

## Why Use Risk Analysis?

- To protect human, life and health as well as other endpoints
- To ensure a more reliable flow of workplace outputs and therefore desirable outcomes
- To improve decision making under uncertainty

- Traditional standards based approaches are no longer enough—problems persist
- National and global communities are embracing risk analysis

# **Risk Management**

- What is the problem?
- What questions do we want risk assessment to answer?
- What can be done to reduce the impact of the risk described?

foot protection

- What can be done to reduce the likelihood of the risk described?
- What are the trade-offs of the available options?
- What is the best way to address the described ?
- Is it working?

## The Risk Manager's Job!

- Risk managers are responsible for risk analysis; they identify or validate problems
- Risk managers need scientific information to make decisions under uncertainty
  - They ask questions, which when answered yield the information needed to make decisions

## The Risk Manager's Job!

- Risk assessors answer the questions and characterize the uncertainty in their answers
- Risk managers mitigate risks that are not acceptable and take risks that are prudent
- Risk managers make sure that risk communication takes place

![](_page_13_Picture_4.jpeg)

# **Risk Management Process**

Problem Identification 1. Problem recognition 2.Problem acceptance 3. Problem definition

Risk Monitoring 1. Monitoring 2. Evaluation 3. Iteration

#### **Risk Estimation**

 Establish risk analysis process
 Individual risk management activities

Risk Control 1.Formulating RMO's 2.Evaluationg RMO's 3. Comparing RMO's 4.Choosing an RMO 5. ID decision outcomes Implement decisig

#### **Risk Evaluation**

1. Principles for establishing acceptable risks and tolerable levels of risk

2. The decision

# Who Are the Risk Managers?

- OSHA? State? Company? Workers?
- There need to be many risk managers
- Who "owns" what part of the risk?

![](_page_15_Picture_4.jpeg)

# **Risk Management Strategies**

<b>Risk Management Strategies</b>	
Accept the risk as is?	
<b>Risk Reduction</b>	Risk Taking
Risk Avoidance	Risk Creation
<b>Risk Prevention</b>	<b>Risk Stimulation</b>
<b>Risk Mitigation</b>	Risk Promotion
Risk Transfer	Risk Sharing
Risk Retention	Risk Ignoring

# **Risk Assessment**

- What can go wrong?
- How can it happen?
- How likely is it?
- What are the consequences?

#### SHOULDERS

10% of joint disorders 10% of all muscle and ligament injuries 30% of all OOS injuries

#### **UPPER/LOWER BACK**

84% of all spinal injuries 38% of all muscle and ligament injuries

#### KNEES

65% of all joint disorders 12% of all muscle and ligament injuries 5% of all OOS injuries NECK 2% of all claims 10% of spinal injuries

#### 7 ARMS

12% of all claims 28% of all muscle and ligament injuries 32% of all bone injuries

#### LEGS

7% of all claims 2% of all muscle and ligament injuries

## **Risk Assessment Model**

An analytical and scientifically based process consisting of the following steps:

#### Look for the Hazard or Opportunity

Identify the hazards that can cause harm or the opportunities for gain that are uncertain.

#### **Consequence Assessment**

Decide who or what may be harmed or benefited and in what ways. Gather and analyze the relevant data. Characterize the consequences and their uncertainty qualitatively or quantitatively.

#### Likelihood Assessment

Assess the likelihood of the various adverse and beneficial consequences. Characterize these likelihoods and their uncertainty qualitatively or quantitatively.

#### **Risk Characterization**

Estimate the probability of occurrence, the severity of adverse consequences, and the magnitude of potential gains, including attendant uncertainties, of the hazards and opportunities identified based on the evidence in the preceding steps. Characterize the risk qualitatively or quantitatively with appropriate attention to baseline and residual risks, risk reductions, transformations and transfers.

# EPA (Toxic Air Pollutants)

![](_page_19_Figure_1.jpeg)

# Qualitative Risk Assessment Methods Toolbox

- Increase or Decrease Risk
- Risk Narratives
- Evidence Mapping
- Screening
- Ratings
- Rankings
  - Enhanced Criteria Ranking

- Operational Risk Management (Risk Matrix)
- Develop a Generic Process
- Qualitative Assessment Models
- Multi-Criteria Decision
  Analysis

Probability

![](_page_20_Picture_12.jpeg)

### Quantitative Risk Assessment

- Safety Assessment
- Scenario Planning
- Scenario Analysis
  - Deterministic Scenario Analysis
  - Probabilistic Scenario Analysis
- Sensitivity Analysis
- Uncertainty Analysis
- Modeling
- Vulnerability Assessment

![](_page_21_Figure_10.jpeg)

Diagram of Dose Response Relationship

# **Risk Communication**

- Why are we communicating?
- Who is our audience?
- What do our audiences want to know?
- What do we want to get across?
- How will we communicate?
- How will we listen?
- How will we respond?

## **Risk Communication Goals**

- Tailor communication so it takes into account the emotional response to an event.
- Empowers stakeholders and public to make informed decisions.
- Prevent negative behavior and/or encourage constructive responses to crisis or danger.

![](_page_23_Picture_4.jpeg)

### Scientist - Consumer Disconnect

![](_page_24_Figure_1.jpeg)

Fact-based: hazard, probability

Value-based: consequences, value

### Goal: Reduce outrage so people don't take unnecessary precautions

High

Outrage (fear,anger)

![](_page_25_Figure_3.jpeg)

### Goal: Increase concern for a real hazard to motivate preventive action

![](_page_26_Figure_1.jpeg)

Low

Hazard (danger)

High

### Goal: Acknowledge hazard, validate concern, give people ways to act

![](_page_27_Figure_1.jpeg)

## **Take Away Points**

- Risk analysis comprises three tasks—risk assessment, risk management, and risk communication
- Risk management is decision making under uncertainty that depends on
  - Science & values important to stakeholders
- Risk assessment is evidence gathering

Separates what we know from what we don't know

• Risk communication will vary with the circumstances of the risk
