## Lab-2 \& 3

### 1.1 Beam \& Frame Analysis

Consider the 2-dimensional frame in Figure 17. It is indeterminate to the sixth degree. Assuming that the value of $I$ is $500 \mathrm{in}^{4}$, the area of member AB is $15 \mathrm{in}^{2}$, the area of the remaining members is $10 \mathrm{in}^{2}$, and a Young's modulus of $29,000 \mathrm{ksi}$, the analysis is summarized below.

Figure Error! No text of specified style in document.-1: 2-D Frame Example

1. Follow Steps 1 through 4 in the previous section to provide general information. In step 3, use the default value for the Number of Sections so that internal forces at 5 equally spaced locations along each member will be provided. The frame is composed of 6 joints and 5 members. In step 5 , change the default grid settings to $40 @ 1 \mathrm{ft}$ and $19 @ 1 \mathrm{ft}$ in the X and Y directions, respectively, such that all joints of the frame fall on the grid.
2. Follow Step 7 to enter the joint coordinates (see Figure 18). Alternatively, you can follow Step 14 to specify both joints and members graphically.

| 棈 Joint Coordinates |  |  | - |
| :---: | :---: | :---: | :---: |
| \ $\downarrow$ | Label | X [ft] | Y [f] |
| 1 | A | 0 | 10 |
| 2 | B | 20 | 10 |
| 3 | C | 40 | 10 |
| 4 | D | 40 | 19 |
| 5 | E | 40 | 0 |
| 6 | F | 20 | 0 |

Figure Error! No text of specified style in document.-2: Joint Coordinates for Frame
3. Follow Step 8 to provide information for the Boundary Conditions. Since joints E and F are fix-ended, set the boundary codes for all the directions (X, Y, and rotation) as Fixed (see Figure 19).

Figure Error! No text of specified style in document.-3: Boundary Condition
4. Click Members in the Data Entry toolbar to specify member data, which include the member labels, joint labels at both ends, area, moment of inertia, and Young's modulus (see Figure 20). Note that shearing deformation of the member is ignored in this educational version. If it is desired to ignore the axial deformation of the flexural member, you can specify a large value for the member area.

| 1/h Members |  |  |  |  |  |  |  |  | $\square \square$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 4 - | Label | I Joint | $\checkmark$ Joint | Area[in $\left.{ }^{\wedge} 2\right]$ | Inertia[in ${ }^{\text {a }}$ 4] | Young's[... | I Release | J Release | Length[ft] |
| 1 | M1 | A | B | 15 | 1000 | 29000 |  |  | 20 |
| 2 | M2 | B | C | 10 | 500 | 29000 |  |  | 20 |
| 3 | M3 | F | B | 10 | 500 | 29000 |  |  | 10 |
| 4 | M4 | E | C | 10 | 500 | 29000 |  |  | 10 |
| 5 | M5 | C | D | 10 | 500 | 29000 |  |  | 9 |

Figure Error! No text of specified style in document.-4: Members
5. Skip Joint Loads from the Data Entry toolbar because this example does not have joint loads. Instead, click Point Loads from the Data Entry toolbar to specify the 32-kip point load that acts on member BC (see Figure 21). Click Distributed Loads from the Data Entry toolbar to specify the uniformly distributed load that acts on member AB (see Figure 22). The data entry is now complete. Click View from the manual bar and select Loads to show graphically the applied loads (Figure 23)

Note that you can select the loading direction as $\mathbf{X}, \mathbf{Y}, \mathbf{x}$, or y in the Direction field when specifying either the point load or the distributed load. Directions X and Y refer to the global coordinate system (see Figure 2), while directions $x$ and $y$ refer to the local coordinate system of a member. As can be seen from Figure 24, the local x -axis corresponds to the member centerline. The positive direction of this local x - axis is from I joint towards J joint. The local z -axis is always normal to the plane of the model with positive $z$ being towards you. The local $y$-axis is then defined by the right-hand rule. When a member is inclined, it is sometimes more convenient to specify the point load or transverse load in the local coordinate system.

6. Now click Solve from the manual bar to perform the structural analysis. Click Joint Reactions from the Results toolbar to view the reaction forces (see Figure 25). Click Joint Deflections for the deflections and rotation at each joint (see Figure 26). Click Member Deflections if you are interested in the deflections of the members (see Figure 27). The member internal forces at equally spaced sections along each member can be viewed by clicking Member Forces (see Figure 28). The sign convention of the internal forces is defined in Figure 15.

7. Analysis results can also be viewed graphically in the Model View window by clicking on the icons below the manual bar (see Figure 29). (If this window does not appear, click View from the manual bar and select New View to create one.) For example, Figure 30 shows the moment diagrams, reactions, and the deflected shape of the structure. Figure 31 depicts the reactions together with the applied loads.

Figure Error! No text of specified style in document.-14: Graphical Representation of SFD and Deflection

Figure Error! No text of specified style in document.-15: Graphical Representation of Reactions

Develop the SFD and BMD of the following beams and find the reactions using RISA-2D
Task-1: A and B are the Roller Support and C is the Pin Support

Task-2: B, D and F are the Roller Support and A is the Pin Support, whereas C and E are the pin connection

Task-3: A is the Pin Support and B is the roller support

Task-4: A is the roller support; B is the Fixed Support and C is the pin connection

Task-5: A is the roller support; B is the Fixed Support and C is the pin connection

## Lab-4

Develop the SFD and BMD of the following Frames and find the reactions using RISA-2D
Task-1: A and B are the Pin Support and C is the Pin connection

Task-2: A, C are the Pin Support, whereas B is the pin connection

Task-3: A and C is the Pin Support and B is the Pin connection

Task-4: C is the Fix support; C is the roller support.

Task-5: A and D, are the Pin support; B is the pin connection
