101 Practical

1st Semester

$$1 \text{ sq K} =$$

$$K \cdot 29 =$$

$$A = w \times l$$

The difference b/w the Acre & hectare:

STUDENT PHOTOSTAT

LAND MEASURING UNITS OF

PAKISTAN

CONVENTIONAL System*:-

$$1 \text{ Square} = 25 \text{ Acre}$$

* It is the biggest unit

$$1 \text{ Acre} = 198 \text{ ft} \times 220 \text{ ft}$$

$$\text{AREA} = \text{width} \times \text{length}$$

$$\begin{aligned} \text{Area of 1 acre} &= 198 \times 220 \text{ ft}^2 \\ &= 43560 \text{ ft}^2 \\ &= 4840 \text{ K} \end{aligned}$$

$$1 \text{ KARAM} = 5.5 \text{ ft} = (\text{two normal feet step})$$

When

$$198 / 5.5 = 220 / 5.5$$

$$36 \text{ Karam} = 40 \text{ Karam}$$

$$* 1 \text{ Acre} = 160 \text{ Marlas}$$

$$= 8 \text{ Kanals}$$

$$= 2 \text{ Begas}$$

$$8 \text{ Kanal} = 160 \text{ Marlas}$$

$$1 \text{ Kanal} = 20 \text{ Marlas}$$

$$1 \text{ Kanal} = \frac{160}{8} = 20 \text{ Marlas}$$

$$* 1 \text{ Marla} = \frac{8}{9} (\text{Karam})^2$$

$$= \frac{8}{9} (5.5)^2$$

$$= \frac{8}{9} (5.5 \times 5.5)$$

DIAGRAM OF IDEAL ACRE.

$$1 \text{ Acre} = 2 \text{ Bega}$$

$$1 \text{ Bega} = 4 \text{ Kanals}$$

$$= 80 \text{ Marlas}$$

$$\star \text{ Area of Acre (1 Bega)} = 1440/2 \text{ K}^2 = 720 \text{ K}^2$$

$$\star 1 \text{ Bega} = \text{Half Acre} = 21780 \text{ ft}^2$$

$$\star 1 \text{ Marla} = 9 \text{ Sarsahi} = (\text{smallest unit})$$

$$= 9 \text{ (Karam)}^2$$

$$1 \text{ Sarsahi} = 1 \text{ (Karam)}^2$$

$$= (5.5)^2$$

$$= 30.25 \text{ ft}^2$$

$$\star 1 \text{ Kanal} = 20 \text{ Marlas}$$

$$160 \text{ Marlas} = 8 \text{ Kanals}$$

$$= 43560/8 = 5445 \text{ ft}^2$$

$$\star 1 \text{ Acre} = 43560 \text{ ft}^2$$

$$1 \text{ Acre} = 8 \text{ Kanals} \quad (\text{both are equal})$$

\star :- All the units are acre, Sarsahi are used in

$$\text{Sub continent} \quad 20(272.25) = 5445 \text{ ft}^2$$

It is the 2nd method, by this method we calculate it easily

$$1 \text{ Bega} = 4 \text{ Kanals}$$

$$(i) \quad 4(5445)$$

$$(ii) \quad 80(272.25)$$

$$(iii) \quad 43560/2$$

By these three methods, we calculate the same value.

$$\star 1 \text{ Killa} = 220' \times 180' = 220'$$

$$\text{Acre} = 18400 \text{ ft}^2$$

$$\text{Difference} = 48400 - 43560$$

$$= 4840 \text{ ft}^2$$

$$= 4840 / 272.25 = 17.777 \text{ marlas}$$

$$\star (48400) \text{ 1 Killa} = 8 \text{ Kanals} + 17 \text{ Marlas}$$

$$= ~~43560~~ + ~~7~~ Sarsahi$$

$$= ~~0.7777 \times 9 = 6.993~~$$

$$\star 4840 \text{ ft}^2 \cdot 272.25 \text{ ft}^2 = 1 \text{ Marla} = 1 \times 4840 / 272.25 = 17.777 \text{ marlas}$$

$$\star \text{Area of 1 Killa} = 48400 - 43560 = 4840$$

$$1 \text{ Marlas} = 9 \text{ Sarsahi}$$

$$0.7777 = 9 \times 0.7777$$

$$\text{These are all the units} = 7.6602$$

which are used as local units

$$1 \text{ Square} = 25 \text{ Acre}$$

⇒ METRIC SYSTEM ⇒

In this system we calculate the area in Square Feet

The difference b/w The Mound (بن)

Quantam & ton :-

$$\begin{array}{l} 1 \text{ mound} = \underline{40 \text{ kg}} \\ 1 \text{ Q} = \underline{100 \text{ kg}} \\ 1 \text{ ton} = \underline{1000 \text{ kg}} \end{array}$$

$$1 \text{ m} = 3.28 \text{ feet}$$

$$1 \text{ foot} = 12 \text{ inch.},$$

$$1 \text{ inch} = 2.54 \text{ cm}$$

$$1 \text{ Karam} = 5.5'$$

In conversion these units are used & one unit is converted into another in numericals.

$$* \quad 1 \text{ hectare} = 2.471 \text{ acres}$$

$$= 10000 \text{ m}^2 = 108900 \text{ ft}^2 = 1000 (3.3)^2 = 108900 \text{ ft}^2$$

If $(1 \text{ m} = 3.28')$ then the answer will be 107584 ft^2

$$* \quad 1 \text{ Acre} = 8 \text{ Kanal} = 4000/8 = 500 \text{ m}^2$$

$$= \text{Kanal}$$

$$= 160 \text{ marlas} = 4000/16 = 250 \text{ m}^2$$

$$= 2 \text{ Begas} = 4000/2 = 2000 \text{ m}^2 \text{ Begas}$$

$$1 \text{ Ka} = 1000 \text{ m}^2$$

$$1 \text{ Karam} = 5.5/3.28 \text{ m}$$

$$= 1.67 \text{ m}$$

No of Karam direct convert into meters.

$$1 \text{ Karam} = 5.5'$$

$$1 \text{ m} = 3.28'$$

$$1' = 12''$$

Hand Tools

1

Sickle:-

~~It is used for fodder cutting & harvesting of different crops.~~

e.g :- wheat, Rice or jowar etc.

Sickle

Gahandi

Blade

pelchi Datri:-

- It is used for removing trashes (dry leaves) and tops of sugar cane.

Pilchi Datri

Ghardi

SANGA:-

It is used for uplifiting of bundles at the time of thrashing.

Tarangi

Punja

TARANGI

It is used for collection of straw (leaves & straw portion) when wheat crop is harvest. Through it is used as cutting collecting

So, the raw material obtained from the wheat stems & head after removing the wheat product through thresher or harvesting machine is also collect through tarangi.

JUNDRA :-

It is used for bund (the dividing division of one acre is called bund) making & leveling of small plots.

KHURPA :-

It is used for removing ^{for seeds and} of hoeing (removal of unwanted plants)

BAGURI

It is used for blind bowing in Sugarcane, which is done in Sugar Handle cane & after sowing & before germination by vegetable growth in 3-4 weeks is used for germination.

SPADE :

It is used for making water channels, cleaning of water channels & hoeing, removal of spreading of manures.

Axe

AXE

It is used for wood cutting.

Gandala

Blade

Handle

GANDALA.

It is used for making holes.

KASOLA:-

It is used for hoeing of different crops
by standing position by khurpa.
by sit cutting.

Hand Toka

Hand Toka:-

It is used for harvesting of different crops making Satta of Sugar cane & chapping of fodder.

At the time of Sugar cane cutting. Hand Toka is used for this purpose.

It harvest the Sugar cane at the bottom of Sugar cane & above the surface of Soil or earth. So, it is beneficial for the Sugar cane producer because as this method, the cutting or harvest Sugar cane crop again capacity to produce from 2-3 times again & again.

2009-09-2909.

➔ Numericals

Question 1

Calculate the area in kanals when length of plot is 50 karam and width is 41m?

$$\begin{aligned} \text{Length} &= 50 \text{ karam} \\ &= 50 \times 5.5 = 275 \text{ ft} \\ &= 83.84 \text{ m} \end{aligned}$$

$$1 \text{ K} = 5.5 \text{ ft}$$

$$1 \text{ m} = 3.28$$

$$\begin{aligned} \text{Width} &= 41 \text{ m} \\ \text{Area} &= \text{Length} \times \text{Width} \\ &= 83.84 \times 41 \\ &= 3437.5 \text{ m}^2 \\ &= \frac{3437.5}{500} \text{ Kanals} \\ &= 6.875 \text{ Kanals} \end{aligned}$$

$$\begin{aligned} 1 \text{ Acre} &= 8 \text{ Kanal} \\ 1 \text{ Acre} &= 4000 \text{ m}^2 \end{aligned}$$

$$\frac{3437.5}{500}$$

2nd Method

Question 2:-

Calculate the area of a plot in kanals when length is 135 ft and width is 25m?

$$\text{Length} = 135 \text{ ft}$$

$$\text{Width} = 25 \text{ m}$$

$$\text{Area} = \text{Kanal?}$$

$$\text{Width} = 25 \times 3.28 \quad 1 \text{ m} = 3.28 \text{ ft}$$

$$= 82 \text{ ft}$$

$$\text{Area} = 135 \times 82$$

$$= 11070 \text{ ft}^2$$

$$1 \text{ Acre} = \frac{43560 \text{ ft}^2}{8} = 5445$$

$$= 11070$$

$$= 2.03 \text{ Kanals}$$

$$\text{Since } 1 \text{ Kanal} = 5445 \text{ ft}^2$$

Question 3:-

Calculate the area in marlas, kanals, acres and hectares when length is 150 Karam and width is 100 ft? Or in Bega.

$$\text{Length} = 150 \text{ K} = 5.5 \text{ ft}$$

$$= 825 \text{ ft}$$

$$\text{Width} = 100 \text{ ft}$$

$$\text{Area} = 825 \times 100$$

$$= 82500 \text{ ft}^2$$

Marlas

$$= 82500 = 303.03 \text{ Marlas}$$

$$272.25 \text{ ft}$$

$$1 \text{ M} = 272.25 \text{ ft}^2$$

2009-ag-2909

$$\begin{aligned} \text{Kanals} &= 303.03 \\ &\div 20 \\ &= 15.15 \text{ Kanals} \end{aligned}$$

1K = 20 Marla.

$$\begin{aligned} \text{Acre} &= 15.15 \\ &\div 8 \\ &= 1.89 \text{ Acre} \end{aligned}$$

$$\begin{aligned} \text{Hacters} &= 1.89 \\ &\times 2.471 \\ &= 0.76 \end{aligned}$$

$$\begin{aligned} \text{Bega} &= 1.89 \\ &\div 2 \\ &= 0.945 \text{ begas} \end{aligned}$$

✓ Question 4.

Calculate the area in marlas, Kanals, acre and hacter when length is 440ft and width is 36 Karam?

Length = 440ft

Width = 36 Karam

$$= 36 \times 5.5 \text{ ft}$$

$$= 198 \text{ ft}$$

$$\text{Area} = 440 \times 198$$

$$= 87120 \text{ ft}^2$$

0300-6693536
 ممبرانہ
 پاکستان
 ایسوسی ایشن
 آف
 ایجوکیشنل
 آفیسرز
 اسلام آباد

$$\begin{aligned} \text{Marla} &= 87120 \\ &= 272.25 \\ &= 320 \text{ Marla} \end{aligned}$$

$$\begin{aligned} \text{Kanal} &= 320 \\ &= 20 \\ &= 16 \text{ Kanal} \end{aligned}$$

$$\begin{aligned} \text{Acre} &= 16 \\ &= 8 \\ &= 2 \text{ Acre} \end{aligned}$$

$$\begin{aligned} \text{Hacter} &= 2 \\ &= 2.471 \\ &= 0.809 \text{ ha} \end{aligned}$$

$$\begin{aligned} \text{Bega} &= 2 \\ &= 2 \\ &= 1 \text{ bega} \end{aligned}$$

⇒ Question 5:-

Calculate the area in marlas, Kanal, acre, ha and bega when length is 190m and width is 192 ft.

$$\begin{aligned} \text{Length} &= 190\text{m} \\ \text{Width} &= 190\text{ft} \checkmark \\ &= 190 \times 0.3048 = 57.92\text{m} \\ &= 3.28 \end{aligned}$$

$$\begin{aligned} 55 \\ 16.58 \\ 1\text{m} &= 3.28\text{ft} \\ 3.28\text{ft} &= 1\text{m} \\ 16.58\text{ft} &= 5.06\text{m} \\ &= 3.28 \end{aligned}$$

$$5 \sqrt{5}$$

2009-ag-2909.

Area = 190×57.92

= 11006.08 m²

Marla = $\frac{11006.09}{25}$

= 440.24 Marla.

Kanal = $\frac{11006.09}{500}$

= 220.1 Kanal.

Acre = $\frac{11006.09}{4000}$

= 2.75 acre.

Ha = $\frac{11006.09}{10000}$

= 1.100609 ha.

Bega = $\frac{11006.09}{2000}$

= 5.503 bega.

2nd Method:

Marlas = $\frac{11006.09}{25} = 440.2$ Marlas.

Kanals = $\frac{440.2}{20} = 22.01$ Kanals.

Acres = $\frac{22.01}{8} = 2.75$ Acres.

Ha = $\frac{2.75}{2.471} = 1.11$ ha.

انٹرنیشنل ایئر پورٹ ڈیولپمنٹ اتھارٹی
 0300-6693536

✓ Question 6:-

Calculate the width of a plot when an area is 1ha and length is 150m?

$$\begin{aligned} \therefore \text{Area} &= 1\text{ha} \\ &= 10000\text{m}^2 \quad \because 1\text{ha} = 10000\text{m}^2 \end{aligned}$$

$$\text{length} = 150\text{m}$$

$$\text{Area} = \text{length} \times \text{width}$$

$$\text{width} = \frac{\text{Area}}{\text{length}}$$

$$= \frac{10000}{150}$$

$$= 66.67\text{m} \quad \checkmark$$

$$\begin{aligned} \text{OR} &= 66.67 \times 3.28 \quad (\text{m} \rightarrow \text{ft}) \\ &= 218.67\text{ft} \end{aligned}$$

✓ Question 7:-

Calculate the width of a plot in Karam when area is 2 acre and length is 220ft?

$$\begin{aligned} \therefore 1\text{Acre} &= 43560\text{ft} \\ \text{Area} &= 2\text{Acre} \end{aligned}$$

$$= 2 \times 43560$$

$$= 87120$$

$$= 87120\text{ft}$$

$$\text{width} = \frac{87120}{220}$$

$$= 396\text{ft}$$

$$= 396\text{ft}$$

2009-09-2909.

= 396

= 5.5

= 72 Karam

✓ Question 8.

Calculate the length of a plot, when an area is 96 Kanals and width is 100m?

Area = 96 Kanals.

= 96×500

= 48000 m^2

Width = 100m

Length = $\frac{\text{Area}}{\text{Width}}$

= $\frac{48000}{100}$

= 480m.

✓ Question 9.

Calculate the width when an area of a plot is $\frac{1}{80}$ acre and length is 36 ft.

Area = $\frac{1}{80}$ Acres

= $\frac{1}{80} \times 43560$

= 544.5 ft^2

Length = 36 ft

Width = $\frac{544.5}{36}$

= 15.12 ft.

= 15.12 ft.

36

Question 10.

Calculate the length in meters when an area is $\frac{1}{15}$ ha and width is 45 ft?

$$\text{Area} = \frac{1}{15} \text{ ha}$$

$$= \frac{1}{15} \times 108900 \text{ ft}^2$$

$$= 7260 \text{ ft}^2$$

$$\text{Width} = 45 \text{ ft}$$

$$\text{Length} = \frac{7260}{45}$$

$$= 161.33 \text{ ft}$$

$$= 161.33 \text{ (ft} \rightarrow \text{m)}$$

$$= 161.33 \times 3.29$$

$$= 49.18 \text{ m}$$

"Assignment"

2009-ag-2909.

- 1, Calculate the area in marla, kanal, acre, ha and bega when length is 180m and width is 170 ft?

$$\text{Length} = 180\text{m}$$

$$\text{Width} = 170\text{ft}$$

$$= 170$$

$$3.28$$

$$= 51.82\text{m}$$

$$\text{Area} = 180 \times 51.82$$

$$= 9327.6$$

$$\text{Marla} = \frac{9327.6}{25}$$

$$= 373.10$$

$$= 373.10 \text{ marla}$$

$$\text{Kanal} = \frac{373.10}{20}$$

$$= 18.65$$

$$= 18.65 \text{ Kanal}$$

$$\text{Acre} = \frac{18.65}{8}$$

$$= 2.33$$

$$= 2.33 \text{ Acre}$$

$$\text{ha} = \frac{2.33}{2.471}$$

$$= 0.94$$

$$= 0.94 \text{ ha}$$

$$\text{Bega} = \frac{2.33}{2} = 1.165 \text{ Bega}$$

0300-669355
 0300-669355
 0300-669355

24

(2) Calculate the area in marlas, Kanals, acre, ha and bega when length is 150m and width is 150ft?

$$\text{Length} = 150\text{m}$$

$$\text{Width} = 150\text{ft}$$

$$= 150$$

$$3.28$$

$$= 45.73\text{m}$$

$$\text{Area} = 150 \times 45.73$$

$$= 6859.5\text{m}^2$$

$$\text{Marla} = 6859.5$$

$$25$$

$$= 274.38 \text{ Marla}$$

$$\text{Kanal} = 274.38$$

$$20$$

$$= 13.71 \text{ Kanal}$$

$$\text{Acre} = 13.71$$

$$8$$

$$= 1.714 \text{ Acre}$$

$$\text{ha} = 1.714$$

$$2.471$$

25

2009-09-2909.

(3) Calculate the area in marlas, Kanals, acre, hacter and bega. When length is 320 ft and width is 38 karam?

$$\text{length} = 320 \text{ ft}$$

$$\text{width} = 38 \text{ karam}$$

$$= 38 \times 5.5$$

$$= 209 \text{ ft}$$

$$\text{Area} = 320 \times 209$$

$$= 66880 \text{ ft}^2$$

$$\text{Marla} = \frac{66880}{272.25}$$

$$= 245.6$$

$$= 245.6 \text{ Marlas}$$

$$\text{Kanal} = \frac{245.6}{20}$$

$$= 12.28$$

$$= 12.28 \text{ Kanals}$$

$$\text{Acre} = \frac{12.28}{8}$$

$$= 1.535$$

$$= 1.535 \text{ Acres}$$

$$\text{ha} = \frac{1.535}{2.471}$$

$$= 0.621$$

$$= 0.621 \text{ ha}$$

$$= 0.621$$

$$\text{Bega} = \frac{1.535}{2}$$

$$= 0.7675$$

$$= 0.7675 \text{ begas}$$

4:- Calculate the area in marlas, Kanals, acre, ha and bega when length is 90m and width is 95ft.

$$\text{Length} = 90\text{m.}$$

$$\text{Width} = 95\text{ft}$$

$$= 95$$

$$\times 3.28$$

$$= 28.96\text{m.}$$

$$\text{Area} = 90 \times 28.96$$

$$= 2606.4\text{m}^2$$

$$\text{Marla} = \frac{2606.4}{25}$$

$$= 104.2 \text{ Marlas.}$$

$$\text{Kanal} = \frac{104.2}{20}$$

$$= 5.212 \text{ Kanals.}$$

$$\text{Acre} = \frac{5.212}{8}$$

$$= 0.6515 \text{ Acres.}$$

$$\text{Ha} = \frac{0.6515}{2.471}$$

$$= 0.2636 \text{ ha.}$$

$$\text{Bega} = \frac{0.6515}{2} = 0.32575 \text{ begas.}$$

2009-09-29-09.

5. Calculate the area in marlas, kanals, acres, ha and begas when length is 250 ft and width is 32 Karam.

$$\text{length} = 250 \text{ ft.}$$

$$\text{width} = 32 \times 5.5$$

$$= 176 \text{ ft.}$$

$$\text{Area} = 176 \times 250$$

$$= 44000 \text{ ft}^2$$

$$\text{Marlas} = 44000$$

$$272.25$$

$$= 161.6 \text{ marlas.}$$

$$\text{Kanals} = 161.6$$

$$20$$

$$= 8.08 \text{ Kanal.}$$

$$\text{Acres} = 8.08$$

$$8$$

$$= 1.010 \text{ Acres.}$$

$$\text{ha} = 1.010$$

$$2.471$$

$$= 0.408 \text{ ha.}$$

$$\text{Begas} = 1.010 = 0.505 \text{ Begas.}$$

$$2$$

6. In a field crops are present in the 40% of the total area. These crops are cotton on 3.2 Acre, Sugar cane on 5 acres, Fodder on 1.8 acres, Rice on 3 acres. Calculate total area?

Sol. (a)

Total area = ?

$$40\% \text{ area contains acres} = 3.2 + 1.9 + 5.3$$

$$= 13.$$

$$1\% \text{ area contains acres} = \frac{13 \cdot 12.7}{40}$$

$$100\% \text{ area contains acres} = \frac{13 \cdot 12.7}{40} \times 100$$

$$= \frac{33.5}{31.75} \text{ Acres}$$

(b) Find the remaining area?

$$40\% \text{ crops contain acre} = \frac{13 \cdot 12.7}{40}$$

$$1\% \text{ crops contain acre} = \frac{13 \cdot 12.7}{40}$$

$$60\% \text{ crops contain acre} = \frac{13 \cdot 12.7}{40} \times 60$$

$$= 19.85 \text{ acres.}$$

Units.

$$1 \text{ Tonn} = 1000 \text{ kg.}$$

$$1 \text{ Quintal} = 100 \text{ kg.}$$

2009-09-2909

$$1 \text{ Moand} = 40 \text{ kg.}$$

$$1 \text{ ton} = 10 \text{ Quintal} = 25 \text{ Moand.}$$

7. Calculate the yield of cotton for an area
1 Acre, 2 Kanals, 7 Marlas, when the given yield
as 0.5 kg/m^2 .

$$\text{Area} = 1 \text{ Acre, } 2 \text{ Kanals, } 7 \text{ Marlas}$$

$$0.5 \text{ kg/m}^2$$

$$\text{Yield} = ?$$

Soln.:-

$$\text{Area} = 4000 + 2(500) + 7(25)$$

$$= 5175 \text{ m}^2$$

$$1 \text{ m}^2 \text{ yield} = 0.5$$

$$5175 \text{ m}^2 = 0.5 \times 5175$$

$$= 2587.5$$

If we convert it into quintum

$$25.87$$

If we convert it into tonns.

$$2.587 \text{ Tonns.}$$

2009-ag-2909

$$65:1 \text{ crops contain acre} \cdot \frac{12.8}{35} \times 65$$

$$= 23.77$$

→ Calculate the rice yield in Quantil when Area is 4 Acre, while given yield is 30 kg/Marla?

$$\text{Area} = 4 \text{ Acres.}$$

$$\text{Given yield} = 30 \text{ kg/Marla.}$$

$$\text{Total wheat yield} = 30 \text{ kg}$$

$$1 \text{ Marla yield} = 30 \text{ kg}$$

$$160 \text{ " " " " } = 30 \times 160$$

$$= 4800 \text{ kg.}$$

So, (In Quantil)

$$1 \text{ Acre yield} = 48 \text{ Quantils}$$

$$2 \text{ Acre yield on total area} = 48 \times 4$$

$$= 192 \text{ Quantil}$$

Calculate the yield of cotton for the area 1 Acre, 3 Kanals and 6 Marla when given yield is 0.4? 4 kg/marla m^2

$$\text{Area} = 1 \text{ Acre, 3 Kanal, 6 Marla}$$

$$= 160 + 60 + 6$$

$$= 226 \times 25$$

$$= 5650 \text{ marla m}^2$$

$$\begin{aligned} \text{Yield} &= 0.4 \text{ kg} \\ 565 \text{ marla yield} &= 0.4 \times 565 \\ &= 2260 \text{ kg} \\ &= 22.6 \text{ Quantil} \end{aligned}$$

Calculate the yield of wheat when area is 1 Acre, 4 kanals and 5 marlas when the given yield = 0.6 kg/marla

$$\begin{aligned} \text{Area} &= 1 \text{ Acre, } 4 \text{ Kanals, } 5 \text{ Marlas} \\ &= 160 + 80 + 5 \\ &= 245 \times 25 = 6125 \text{ m} \end{aligned}$$

$$\text{Yield} = 0.6 \text{ kg/marla}$$

Total wheat yield = ?

$$1 \text{ marla yield} = 0.6 \text{ kg}$$

$$\begin{aligned} 6125 \text{ " " " } &= 0.6 \times 6125 \\ &= 3675 \text{ kg} \end{aligned}$$

In Quantil = 36.75 Quantil.

Soil Moisture Determination

Methods:

The methods which are used for the determination of water requirements are:-

- i. Gravimetric method.
- ii. Sun dry method.
- iii. Feel and appearance method.
- iv. Tensiometer method.
- v. Neutron prob/ Neutron scattering.
- vi. Gypsum block method.
- vii. Speedy moisture tests.

Gravimetric method:-

The first method which is being used in gravimetric. This method is on weight bases.

- * Take a can and weigh it carefully (W₁).
- * Put a known quantity of soil sample in this can and once again weigh it (W₂).
- * Place it in an oven at a temperature of 100°C - 105°C (to dry the sample) for 24 hours.
- * Weigh the can and dry sample

and calculate the amount of moisture by following formula.

$$W = \frac{W_2 - W_3}{W_3 - W_1} \times 100$$

where

W = Amount of moisture.

Sun dry method:-

- * Take a known sample and put it on a sheet paper of known weight.
- * Place the sheet in sunshine for 7 hours if season is cool and for 5 hours if season is hot.
- * We can determine the moisture by following formula.

$$W = \frac{W_2 - W_3}{W_3 - W_1} \times 100$$

where:-

- W = Soil moisture
- W₁ = weight of sheet
- W₂ = weight of sheet + Soil sample
- W₃ = weight of sheet + Dried sample

Feel and appearance method

It is very simple method

*:- Take some soil in hand if you are successful in forming a ball of soil it means that there is sufficient amount of moisture and there is no need of irrigation.

Jensimeter method:-

*:- Take a porous cup. Fill it with water, keeping in view that no air bubbles are present in it. Then go to field, dig the soil upto a depth of 6 inches (15 cms) and put the porous cup in the soil.

*:- Put some soil around the porous cup. If concentration of water is more in the cup the water will come out from cup and will move towards the soil particle and vice versa.

Neutron probe method:-

Neutron scattering is a technique for measuring total soil water content by volume.

This method estimates the amount of water in a volume of soil by measuring the amount of hydrogen present.

A neutron probe consists of fast or high energy neutron and a detector, both are housed in a unit which is lowered into an access tube, installed in the soil.

The probe is connected by the cable to a control unit which remains on the surface. Access tubes should be installed at least to the depth of expected rooting zones.

The control unit includes electronics for time control, amplifier, memory and other electronics for processing readings.

Fast neutrons emitted from the source and passing through the access tube into the surrounding soil gradually lose their energy through collisions with other atomic nuclear. Hydrogen molecules in the soil (mostly in soil water) are particularly effective in slowing the fast neutrons, since they are both of near equal mass the result is a cloud of slow or thermalized neutrons. The size and density of cloud depend upon soil type and soil water content. Thermalized neutrons which pass through

the detector create a small electrical impulse. These electrical pulses are amplified and then counted.

The number of slow neutrons counted in a specific interval of time is linearly related to the total volumetric soil water content. A higher count indicate high soil water content & vice versa.

Gypsum blocks or electrical

resistance block method:-

Resistance measurement of buried gypsum blocks in the soil is the most common method used to determine the soil moisture content.

- ★:- Saturate the gypsum blocks with water.
- ★:- Make a hole of appropriate size in the soil to the required depth.
- ★:- Place the saturated gypsum blocks at specific depths. Keeping the wire terminals out of the soil, the moisture within the blocks and surrounding soil will tend to make an equilibrium by flowing out of the block into the soil.
- ★:- After the equilibrium is maintained (about 2 hours after installation)

★:- Connect the wire terminals to moisture meter and take readings.

This method describes the procedures for determining the moisture content of soils and other materials. The reaction of water with Calcium carbide produces acetylene gas which activates a pressure gauge that is calibrated to read as percent moisture.

WEATHER FORECASTING

variation in weather conditions at a particular time at a particular place. An advance indication to the probable weather conditions of a particular place is known as weather forecasting.

Methods of Weather Forecasting:-

1. The Weather Chart:-

The meteorological data viz: temperature, humidity, sunshine, wind direction, wind velocity, types of cloud, atmospheric pressure are being used for forecasting. There is a network of observations all over the country. The meteorological data from all parts of the country are sent to Central Meteorological Office, and charted on outline map in code word and abbreviations. These are called weather charts.

The forecast of weather for next 24 hours made with the help of the prevailing weather data. For the example, if the atmospheric pressure is low, then there will be a tendency for the wind to blow from surrounding area to the low pressure.

A fall in atmospheric pressure indicates the chances of storm or cyclone.

2- Forecasting through Satellites:-

The forecasting through satellite is more accurate and reliable than the weather chart method. Satellite sends photographs and weather data. The forecast of weather made with the help of these informations.

The forecast information includes the occurrence of rains, prevalence of cloudy weather, the approach of high winds, storms or cyclones, the atmospheric temperature likely to prevail, fog etc.

There are two types of weather forecasting:

- (i) Short range forecast covers a period of not more than 24 hours ahead, and
- (ii) Long range forecast includes a period of 5 to 6 months.

Weather forecasting and Crop

Production:-

Crop growth and development are governed by weather conditions. Weather plays important role in every phase of agricultural activity, from field

preparation to harvesting and storage successful crop production can be achieved by taking appropriate decision in the light of weather conditions. Important agricultural practices such as time of sowing, transplanting, irrigation, fertilizer application, use of pesticides, biocontrol, storage etc, may be modified according to the prediction made in advance.

The meteorological data are being used for forecasting the outbreaks of pests and diseases. The damage caused by pests and diseases can be minimized by timely and effective control measures. The outbreaks of pests and pathogens depend upon the environmental factors. For example, late blight of Potato disease generally appears in the last week of September or in the first week of January. At this period, disease may spread if minimum temperature and relative humidity will be more than 10°C and 75% respectively.

Timely warning by weather forecasting agency about the coming on of a frost can be mitigated by timely measures like arrangement of irrigation, smoky fire etc.

Forecast about scanty rainfall is being issued by weather forecasting

RAIN GAUGE

ستون پورہ قوٹہ سٹیٹ
 ریڈیو بال درمیانی بیورو قوٹہ
 0300-6693536
 ڈیڑھ بجے

The ~~simplest~~ ~~simplest~~ methods of combating drought: are careful collection of rainfall water in tanks, mulching of surface soil and growing of flood tolerant varieties.

Damage to the crops owing to heavy rains or floods can be mitigated by farmers by making the drainage channel and growing of flood tolerant varieties.

METEOROLOGICAL INSTRUMENTS.

The most common weather instruments are:

1. rain gauge
2. hygrometer
3. barometer
4. thermometer
5. wind vane
6. anemometer
7. Soil thermometer.

Rain Gauge:

It is used for measuring rainfall. A rain-gauge is placed on the ground in an open space to receive the rainfall. The depth of the water which has fallen into the container of a rain gauge is measured in mm which

HYGROMETER

is the amount of water fallen in the previous 24 hours.

Hygrometers:-

Hygrometers are instruments which measure the humidity of surrounding air. The wet and dry bulb thermometer is the most common hygrometer. These two thermometers are placed vertically side by side and are graduated in absolute scale. The bulb of one other is dipped in distilled water. When air is not saturated evaporation takes place in the wet bulb thermometer. The greater the evaporation, the lower will be the temperature and hence the great difference between the temperatures of wet and the dry bulb thermometers. From these two thermometers humidity of air is calculated.

FORTIN'S
BAROMETER

Barometer :-

It is used for recording the pressure of the atmosphere. There are two types of barometer,

(i) :- Fortin's barometer

(ii) :- Aneroid barometer

The most common type of barometer is the Fortin's barometer. This instrument consists of a tube having mercury. The tube is made to stand in an inverted position in a leather cup. The column of mercury in the tube is supported by the weight of the atmospheric air. As the pressure decreases, the column of the mercury in the tube also falls, and as the pressure increases, the column of the mercury rises.

SIX'S MAXIMUM AND MINIMUM
THERMOMETER

Thermometers:-

The maximum and minimum thermometers are used for recording maximum and minimum temperature of the air. Six's maximum and minimum thermometer is a combination of maximum and minimum thermometers in one.

Thermometers are kept in Stevenson Screen. It allows air to pass freely but protects the thermometer from rain and sunshine. Stevenson Screen is a double-roofed shelter which is placed on a grass plot at a standard height.

WIND VANE

Wind Vane:-

It indicates the direction of wind. It consists essentially an arrow mounted on ball-bearing in the horizontal plane to enable the arrow to move freely. Four cross-arms are fixed rigidly below the arrow. These 4 cross-arms are directed towards east, west, north and south. The arrow swings horizontally with a slight movement of the air and adjusts itself in position, showing the direction of wind. For example, a East Wind is one which blows from the East.

ANEMOMETER

Anemometer:-

It is an instrument to measure the velocity of wind. It consists of four cups fixed to the arm to a vertical shaft which moves when the cups are set in motion by wind. The shaft is connected to a dial, on which the velocity of wind is recorded. The stronger the wind, the faster is the rotation of the cups which is recorded in the dial.

Soil Thermometer:-

It is used to find the temperature of the soil at various depths. The depths for which temperature are taken are 15, 30 and 45 cm.

Climate:-

The general kind of weather that a place has year after year is known as the climate. The study of climate is called climatology.

Weather:-

The condition of the atmosphere at a certain time is called weather. Meteorology is the study of weather.

Elements:-

Elements are variable and may change quickly. For example, variation in temperature, humidity etc.

Factors:-

Factors are constant and permanent in nature. For instance, altitude, latitude etc.

Elements of Climate:-

1. The temperature of the air.
2. The pressure of the atmosphere.
3. The direction and velocity of wind.
4. The humidity of the atmosphere.
5. The clouds.
6. The precipitation of rain.

Factors of Climate:-

- | | |
|------------------------|-----------------------------------|
| i. Latitude | iv. Mountains and their direction |
| ii. Altitude | v. Sea currents |
| iii. Distance from sea | vi. Direction of wind |

- vii. Vegetation
- viii. Slope of land
- ix. Soil
- x. Snow

Elements of Weather:-

Primary elements are:-

- 1. Sun
- 2. Air
- 3. Water

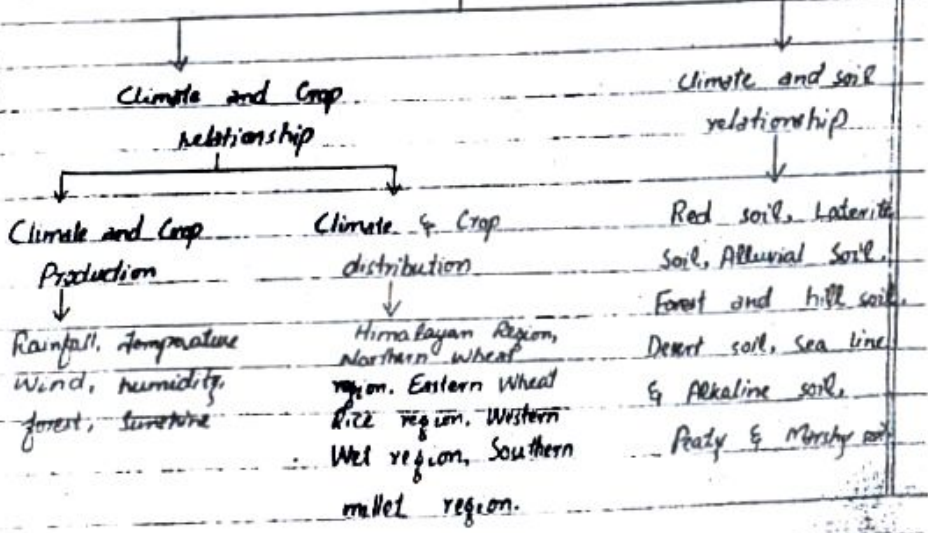

Secondary elements are:-

- i. temperature
- ii. humidity
- iii. rainfall
- iv. atmospheric pressure
- v. clouds
- vi. wind.

Factors of Weather:-

- 1. The mobility of air
- 2. The rotation of the earth on its axis
- 3. The revolution of the earth around the sun.

Climate and Agricultural Relationship

Calculations:-

Given length (conventional unit) = 9 Karam
 Given width (conventional unit) = 2 Karam

Conversion into metric system:-

Length = $9 \times 5.5 = 49.5 \text{ ft}$
 $\frac{49.5}{3.3} = 15 \text{ m}$
 width = $2 \times 5.5 = 11 \text{ ft}$
 $\frac{11}{3.3} = 3.33 \text{ m}$

Observed readings:-

length = $47 \text{ ft} = \frac{47}{3.3} = 14.24 \text{ m}$
 width = $8.5 \text{ ft} = \frac{8.5}{3.3} = 2.57 \text{ m}$

Differences:-

in length = $49.5 - 47 = 2.5 \text{ ft} = 0.75 \text{ m}$
 in width = $11 - 8.5 = 2.5 \text{ ft} = 0.75 \text{ m}$

Conclusion:-

There is a difference between actual and observed readings & this is due to difference in footsteps of survey person.

Agronomy - 17/3/11

One ton = 1000 kg = 25 mounds

One mound = 40 kg

One quintal = 100 kg = 2.5 mounds

NUMERICAL 1

Numerical No. 1:

Calculate the area of a plot in acres which has the following dimensions:

L = 95 Karam, W = 19 Karam

also calculate the yield of the plot if the per acre yield is 100 kg

Calculations:

$$A = L \times W = 19 \times 95 = 1805 \text{ Sq. Karam}$$

$$\text{one acre} = 1440 \text{ Sq. Karam}$$

$$\text{if } 1440 \text{ Sq. Karam} = 1 \text{ acre}$$

$$1805 \text{ Sq. Karam} = \frac{1805}{1440}$$

$$= 1.25 \text{ acre}$$

$$\text{yield per acre} = 100 \text{ kg}$$

$$\text{yield per } 1.25 = 100 \times 1.25 = 125 \text{ kg}$$

Numerical No. 2

Calculate the area of a plot which has following dimensions
L = 30 Karam, W = 8 Karam
also calculate the yield of the plot when yield is 160 kg per acre.

Calculations:

$$\text{Area} = L \times W = 30 \times 8 = 240 \text{ Sq. Karam}$$

$$\text{as } 1 \text{ acre} = 1440 \text{ Sq. Karam}$$

$$1440 \text{ Sq. Karam} = 1 \text{ acre}$$

$$1 \text{ Sq. Karam} = \frac{1}{1440} \text{ acre}$$

$$240 \text{ Sq. Karam} = \frac{240}{1440} \text{ acre}$$

$$= 0.167 \text{ acre}$$

$$\text{yield per acre} = 160 \text{ kg}$$

$$0.167 \text{ acre} = 160 \times 0.167 = 26.67 \text{ kg}$$

Numerical No. 3

Area of a plot is $\frac{1}{80}$ of an acre. Calculate the length of this plot if width is 9 feet.

Calculation:

$$\text{Area} = \frac{1}{80} \text{ acre}$$

$$\text{while } 1 \text{ acre} = 43560 \text{ Sq. ft}$$

$$\text{Area of the plot} = \frac{43560}{80} = 544.5 \text{ Sq. ft}$$

$$\text{Length} = \frac{\text{Area}}{\text{width}}$$

$$= \frac{544.5}{9}$$

$$= 60.5 \text{ ft}$$

Numerical No. 5.

Area of a plot is $\frac{1}{20}$ acre.
Calculate width if length is 30 feet.

Calculation:

Area of a plot = $\frac{1}{20}$ acre.

1 acre = 43560 sq. ft.

$$\text{Area} = 43560 / 20 = 2178 \text{ sq. ft.}$$

$$L = 30 \text{ ft.}$$

$$W = \text{Area} / \text{Length}$$

$$W = 2178 / 30 = 72.6 \text{ ft.}$$

Numerical No. 6.

Calculate the width of the plot if its width is 15 ft. Area is $\frac{1}{180}$ acre. Also calculate the yield in Kg if yield is 5 tons/acre.

Calculation:

1 acre = 43560 sq. ft.

$$\text{Area of the plot} = 43560 / 180 \text{ sq. ft.}$$

$$\text{Length} = \text{Area} / \text{width} = \frac{544.5}{15}$$

$$= 36.3 \text{ ft.}$$

$$1 \text{ acre is producing} = 5 \text{ tons} = 5 \times 1000 = 5,000 \text{ Kg}$$

$$544.5 \text{ sq. ft. in } \frac{1}{180} \text{ acre} = \frac{5,000 \times 544.5}{43560}$$

Numerical no. 7.

A farm of 20 acre yielded 150 tons of grains. Calculate the yield of a plot measuring 50x15 feet.

Calculations:

$$\text{Area} = 50 \times 15 = 750 \text{ sq. ft.}$$

$$1 \text{ acre} = 43560 \text{ sq. ft.}$$

$$\text{Area} = 750 / 43560 = 0.0172 \text{ acre}$$

$$\text{yield per 20 acre} = 150 \text{ tons}$$

$$\text{yield per 1 acre} = 150 / 20 = 7.5 \text{ tons}$$

$$0.0172 \text{ acre produces} = 7.5 \times 0.0172 = 0.129 \text{ tons}$$

$$1 \text{ ton is} = 1000 \text{ Kg}$$

$$0.129 \text{ ton} = 1000 \times 0.129$$

$$= 129 \text{ Kg}$$

Numerical No. 8.

A plot measuring 4.5x15 feet yield 30 kg. Find out yield per hectare.

Calculations:

$$\text{Area} = 4.5 \times 15 = 67.5 \text{ sq. ft.}$$

$$1 \text{ acre} = 43560 \text{ sq. ft.}$$

$$43560 \text{ sq. ft.} = 1 \text{ acre}$$

$$67.5 \text{ sq. ft.} = 67.5 / 43560 = 0.0155 \text{ acre}$$
